3 Predicative Higher-Order Propositional Logic

Fix sets of *proof variables* and *term variables*.

The syntax of the system is given by the following grammar.

Proof	δ	$::=$	$p \mid \delta\delta \mid \lambda p : \phi. \delta$
Term	M, ϕ	$::=$	$x \mid \perp \mid MM \mid \phi \rightarrow \phi \mid \lambda x : A. M$
Type	A	$::=$	$\Omega \mid A \rightarrow A$
Context	Γ	$::=$	$\langle \rangle \mid \Gamma, p : \phi \mid \Gamma, x : A$
Judgement	\mathcal{J}	$::=$	$\Gamma \text{ valid} \mid \Gamma \vdash \delta : \phi \mid \Gamma \vdash M : A$

where p ranges over proof variables and x ranges over term variables. The variable p is bound within δ in the proof $\lambda p : \phi. \delta$, and the variable x is bound within M in the term $\lambda x : A. M$. We identify proofs and terms up to α -conversion.
