

# Type Theories with Computation Rules for the Univalence Axiom

Robin Adams

March 11, 2016

## 1 Preliminaries

```
module Prelims where

postulate Level : Set
postulate zro : Level
postulate suc : Level → Level
{-# BUILTIN LEVEL Level #-}
{-# BUILTIN LEVELZERO zro #-}
{-# BUILTIN LEVELSUC suc #-}
```

### 1.1 The Empty Type

```
data False : Set where
```

### 1.2 Conjunction

```
data _∧_ {i} (P Q : Set i) : Set i where
  _,_ : P → Q → P ∧ Q

π1 : ∀ {i} {P Q : Set i} → P ∧ Q → P
π1 (x , _) = x

π2 : ∀ {i} {P Q : Set i} → P ∧ Q → Q
π2 (_, y) = y
```

### 1.3 Functions

```
infix 75 _∘_
_∘_ : ∀ {A B C : Set} → (B → C) → (A → B) → A → C
(g ∘ f) x = g (f x)
```

## 1.4 Equality

We use the inductively defined equality  $=$  on every datatype.

```

infix 50 _≡_
data _≡_ {A : Set} (a : A) : A → Set where
  ref : a ≡ a

subst : ∀ {i} {A : Set} (P : A → Set i) {a} {b} → a ≡ b → P a → P b
subst P ref Pa = Pa

subst2 : ∀ {A B : Set} (P : A → B → Set) {a a' b b'} → a ≡ a' → b ≡ b' → P a b → P a' b
subst2 P ref ref Pab = Pab

sym : ∀ {A : Set} {a b : A} → a ≡ b → b ≡ a
sym ref = ref

trans : ∀ {A : Set} {a b c : A} → a ≡ b → b ≡ c → a ≡ c
trans ref ref = ref

wd : ∀ {A B : Set} (f : A → B) {a a' : A} → a ≡ a' → f a ≡ f a'
wd _ ref = ref

wd2 : ∀ {A B C : Set} (f : A → B → C) {a a' : A} {b b' : B} → a ≡ a' → b ≡ b' → f a b ≡ f a' b'
wd2 _ ref ref = ref

module Equational-Reasoning (A : Set) where
  infix 2 ∴_
  ∴_ : ∀ (a : A) → a ≡ a
  ∴ _ = ref

  infix 1 _≡_[_]
  _≡_[_] : ∀ {a b : A} → a ≡ b → ∀ c → b ≡ c → a ≡ c
  δ ≡ c [ δ' ] = trans δ δ'

  infix 1 _≡_[[_]]
  _≡_[[_]] : ∀ {a b : A} → a ≡ b → ∀ c → c ≡ b → a ≡ c
  δ ≡ c [[ δ' ]] = trans δ (sym δ')

```

## 2 Datatypes

We introduce a universe **FinSet** of (names of) finite sets. There is an empty set  $\emptyset : \mathbf{FinSet}$ , and for every  $A : \mathbf{FinSet}$ , the type  $A + 1 : \mathbf{FinSet}$  has one more element:

$$A + 1 = \{\perp\} \uplus \{\uparrow a : a \in A\}$$

```

data FinSet : Set where
  ∅ : FinSet
  Lift : FinSet → FinSet

data El : FinSet → Set where
  ⊥ : ∀ {V} → El (Lift V)
  ↑ : ∀ {V} → El V → El (Lift V)

lift : ∀ {A} {B} → (El A → El B) → El (Lift A) → El (Lift B)
lift _ ⊥ = ⊥
lift f (↑ x) = ↑ (f x)

```

### 3 Grammars

```

module Grammar where

```

```

open import Prelims

```

Before we begin investigating the several theories we wish to consider, we present a general theory of syntax and capture-avoiding substitution.

A *grammar* consists of:

- a set of *expression kinds*;
- a set of *constructors*, each with an associated *constructor kind* of the form

$$((A_{11}, \dots, A_{1r_1})B_1, \dots, (A_{m1}, \dots, A_{mr_m})B_m)C \quad (1)$$

where each  $A_{ij}$ ,  $B_i$  and  $C$  is an expression kind.

- a binary relation of *parenthood* on the set of expression kinds.

A constructor  $c$  of kind (1) is a constructor that takes  $m$  arguments of kind  $B_1, \dots, B_m$ , and binds  $r_i$  variables in its  $i$ th argument of kind  $A_{ij}$ , producing an expression of kind  $C$ . We write this expression as

$$c([x_{11}, \dots, x_{1r_1}]E_1, \dots, [x_{m1}, \dots, x_{mr_m}]E_m) . \quad (2)$$

The subexpressions of the form  $[x_{i1}, \dots, x_{ir_i}]E_i$  shall be called *abstractions*, and the pieces of syntax of the form  $(A_{i1}, \dots, A_{ij})B_i$  that occur in constructor kinds shall be called *abstraction kinds*.

```

mutual

```

```

  data KindClass (ExpressionKind : Set) : Set where
    -Expression  : KindClass ExpressionKind
    -Abstraction : KindClass ExpressionKind
    -Constructor : ExpressionKind → KindClass ExpressionKind

```

```

data Kind (ExpressionKind : Set) : KindClass ExpressionKind → Set where
  base : ExpressionKind → Kind ExpressionKind -Expression
  out  : ExpressionKind → Kind ExpressionKind -Abstraction
   $\Pi$    : ExpressionKind → Kind ExpressionKind -Abstraction → Kind ExpressionKind -Abs
  out2 :  $\forall \{K\} \rightarrow$  Kind ExpressionKind (-Constructor K)
   $\Pi_2$   :  $\forall \{K\} \rightarrow$  Kind ExpressionKind -Abstraction → Kind ExpressionKind (-Constructor K)

AbstractionKind : Set → Set
AbstractionKind ExpressionKind = Kind ExpressionKind -Abstraction

ConstructorKind :  $\forall \{ExpressionKind\} \rightarrow$  ExpressionKind → Set
ConstructorKind {ExpressionKind} K = Kind ExpressionKind (-Constructor K)

record Taxonomy : Set1 where
  field

data ExpressionKind : Set where
  varKind : VarKind → ExpressionKind
  nonVarKind : NonVarKind → ExpressionKind

record ToGrammar (T : Taxonomy) : Set1 where
  open Taxonomy T
  field
    Constructor      :  $\forall \{K : ExpressionKind\} \rightarrow$  ConstructorKind K → Set
    parent           : VarKind → ExpressionKind

```

An *alphabet*  $V = \{V_E\}_E$  consists of a set  $V_E$  of *variables* of kind  $E$  for each expression kind  $E$ . The *expressions* of kind  $E$  over the alphabet  $V$  are defined inductively by:

- Every variable of kind  $E$  is an expression of kind  $E$ .
- If  $c$  is a constructor of kind (1), each  $E_i$  is an expression of kind  $B_i$ , and each  $x_{ij}$  is a variable of kind  $A_{ij}$ , then (2) is an expression of kind  $C$ .

Each  $x_{ij}$  is bound within  $E_i$  in the expression (2). We identify expressions up to  $\alpha$ -conversion.

```

data Alphabet : Set where
   $\emptyset$  : Alphabet
  _,_ : Alphabet → VarKind → Alphabet

data Var : Alphabet → VarKind → Set where
  x0 :  $\forall \{V\} \{K\} \rightarrow$  Var (V , K) K
   $\uparrow$  :  $\forall \{V\} \{K\} \{L\} \rightarrow$  Var V L → Var (V , K) L

```

```

extend : Alphabet → VarKind → FinSet → Alphabet
extend A K ∅ = A
extend A K (Lift F) = extend A K F , K

embed : ∀ {A} {K} {F} → El F → Var (extend A K F) K
embed ⊥ = x0
embed (↑ x) = ↑ (embed x)

data Expression' (V : Alphabet) : ∀ C → Kind ExpressionKind C → Set where
  var : ∀ {K} → Var V K → Expression' V -Expression (base (varKind K))
  app : ∀ {K} {C : ConstructorKind K} → Constructor C → Expression' V (-Constructor K) C
  out : ∀ {K} → Expression' V -Expression (base K) → Expression' V -Abstraction (out K)
  Λ : ∀ {K} {A} → Expression' (V , K) -Abstraction A → Expression' V -Abstraction (out K)

Expression'' V K = Expression' V -Expression (base K)

Body' : Alphabet → ∀ K → ConstructorKind K → Set
Body' V K C = Expression' V (-Constructor K) C

Abstraction' : Alphabet → AbstractionKind ExpressionKind → Set
Abstraction' V K = Expression' V -Abstraction K

Given alphabets  $U$ ,  $V$ , and a function  $\rho$  that maps every variable in  $U$  of
kind  $K$  to a variable in  $V$  of kind  $K$ , we denote by  $E\{\rho\}$  the result of replacing
every variable  $x$  in  $E$  with  $\rho(x)$ .

Rep : Alphabet → Alphabet → Set
Rep U V = ∀ K → Var U K → Var V K

_~R_ : ∀ {U} {V} → Rep U V → Rep U V → Set
ρ ~R ρ' = ∀ {K} x → ρ K x ≡ ρ' K x

embedl : ∀ {A} {K} {F} → Rep A (extend A K F)
embedl {F = ∅} _ x = x
embedl {F = Lift F} K x = ↑ (embedl {F = F} K x)

The alphabets and replacements form a category.

idRep : ∀ V → Rep V V
idRep _ _ x = x

infixl 75 _•R_
_•R_ : ∀ {U} {V} {W} → Rep V W → Rep U V → Rep U W

```

$$(\rho' \bullet_R \rho) K x = \rho' K (\rho K x)$$

--We choose not to prove the category axioms, as they hold up to judgemental equality.

Given a replacement  $\rho : U \rightarrow V$ , we can ‘lift’ this to a replacement  $(\rho, K) : (U, K) \rightarrow (V, K)$ . Under this operation, the mapping  $(-, K)$  becomes an endofunctor on the category of alphabets and replacements.

$$\begin{aligned} \text{Rep}\uparrow & : \forall \{U\} \{V\} \{K\} \rightarrow \text{Rep } U \ V \rightarrow \text{Rep } (U, K) \ (V, K) \\ \text{Rep}\uparrow \_ \_ x_0 & = x_0 \\ \text{Rep}\uparrow \rho \ K \ (\uparrow x) & = \uparrow (\rho K x) \end{aligned}$$

$$\begin{aligned} \text{Rep}\uparrow\text{-wd} & : \forall \{U\} \{V\} \{K\} \{\rho \ \rho' : \text{Rep } U \ V\} \rightarrow \rho \sim_R \rho' \rightarrow \text{Rep}\uparrow \{K = K\} \rho \sim_R \text{Rep}\uparrow \rho' \\ \text{Rep}\uparrow\text{-wd } \rho\text{-is-}\rho' \ x_0 & = \text{ref} \\ \text{Rep}\uparrow\text{-wd } \rho\text{-is-}\rho' \ (\uparrow x) & = \text{wd } \uparrow (\rho\text{-is-}\rho' \ x) \end{aligned}$$

$$\begin{aligned} \text{Rep}\uparrow\text{-id} & : \forall \{V\} \{K\} \rightarrow \text{Rep}\uparrow (\text{idRep } V) \sim_R \text{idRep } (V, K) \\ \text{Rep}\uparrow\text{-id } x_0 & = \text{ref} \\ \text{Rep}\uparrow\text{-id } (\uparrow \_) & = \text{ref} \end{aligned}$$

$$\begin{aligned} \text{Rep}\uparrow\text{-comp} & : \forall \{U\} \{V\} \{W\} \{K\} \{\rho' : \text{Rep } V \ W\} \{\rho : \text{Rep } U \ V\} \rightarrow \text{Rep}\uparrow \{K = K\} (\rho' \bullet_R \rho) \sim \\ \text{Rep}\uparrow\text{-comp } x_0 & = \text{ref} \\ \text{Rep}\uparrow\text{-comp } (\uparrow \_) & = \text{ref} \end{aligned}$$

Finally, we can define  $E\langle\rho\rangle$ , the result of replacing each variable  $x$  in  $E$  with  $\rho(x)$ . Under this operation, the mapping  $\text{Expression} \rightarrow K$  becomes a functor from the category of alphabets and replacements to the category of sets.

$$\begin{aligned} \text{rep} & : \forall \{U\} \{V\} \{C\} \{K\} \rightarrow \text{Expression}' \ U \ C \ K \rightarrow \text{Rep } U \ V \rightarrow \text{Expression}' \ V \ C \ K \\ \text{rep } (\text{var } x) \ \rho & = \text{var } (\rho \_ x) \\ \text{rep } (\text{app } c \ EE) \ \rho & = \text{app } c \ (\text{rep } EE \ \rho) \\ \text{rep } (\text{out } E) \ \rho & = \text{out } (\text{rep } E \ \rho) \\ \text{rep } (\Lambda E) \ \rho & = \Lambda (\text{rep } E \ (\text{Rep}\uparrow \rho)) \\ \text{rep } \text{out}_2 \_ & = \text{out}_2 \\ \text{rep } (\text{app}_2 \ E \ F) \ \rho & = \text{app}_2 \ (\text{rep } E \ \rho) \ (\text{rep } F \ \rho) \end{aligned}$$

mutual

$$\begin{aligned} \text{infix } 60 \ \_ \langle \_ \rangle \\ \_ \langle \_ \rangle & : \forall \{U\} \{V\} \{K\} \rightarrow \text{Expression}' \ U \ K \rightarrow \text{Rep } U \ V \rightarrow \text{Expression}' \ V \ K \\ \text{var } x \ \langle \rho \rangle & = \text{var } (\rho \_ x) \\ (\text{app } c \ EE) \ \langle \rho \rangle & = \text{app } c \ (EE \ \langle \rho \rangle B) \end{aligned}$$

$$\begin{aligned} \text{infix } 60 \ \_ \langle \_ \rangle B \\ \_ \langle \_ \rangle B & : \forall \{U\} \{V\} \{K\} \{C : \text{ConstructorKind } K\} \rightarrow \text{Expression}' \ U \ (-\text{Constructor } K) \ C \rightarrow \\ \text{out}_2 \ \langle \rho \rangle B & = \text{out}_2 \\ (\text{app}_2 \ A \ EE) \ \langle \rho \rangle B & = \text{app}_2 \ (A \ \langle \rho \rangle A) \ (EE \ \langle \rho \rangle B) \end{aligned}$$

```

This provides us with the canonical mapping from an expression over  $V$  to an expression over  $(V, K)$ :

$\text{liftE} : \forall \{V\} \{K\} \{L\} \rightarrow \text{Expression}'' \ V \ L \rightarrow \text{Expression}'' \ (V, K) \ L$   
 $\text{liftE } E = \text{rep } E \ (\lambda \_ \rightarrow \uparrow)$

A *substitution*  $\sigma$  from alphabet  $U$  to alphabet  $V$ ,  $\sigma : U \Rightarrow V$ , is a function  $\sigma$  that maps every variable  $x$  of kind  $K$  in  $U$  to an *expression*  $\sigma(x)$  of kind  $K$  over  $V$ . Then, given an expression  $E$  of kind  $K$  over  $U$ , we write  $E[\sigma]$  for the result of substituting  $\sigma(x)$  for  $x$  for each variable in  $E$ , avoiding capture.

$\text{Sub} : \text{Alphabet} \rightarrow \text{Alphabet} \rightarrow \text{Set}$   
 $\text{Sub } U \ V = \forall K \rightarrow \text{Var } U \ K \rightarrow \text{Expression}'' \ V \ (\text{varKind } K)$

$\_ \sim \_ : \forall \{U\} \{V\} \rightarrow \text{Sub } U \ V \rightarrow \text{Sub } U \ V \rightarrow \text{Set}$   
 $\sigma \sim \tau = \forall K \ x \rightarrow \sigma \ K \ x \equiv \tau \ K \ x$

The *identity* substitution  $\text{id}_V : V \rightarrow V$  is defined as follows.

$\text{idSub} : \forall \{V\} \rightarrow \text{Sub } V \ V$   
 $\text{idSub } \_ \ x = \text{var } x$

Given  $\sigma : U \rightarrow V$  and an expression  $E$  over  $U$ , we want to define the expression  $E[\sigma]$  over  $V$ , the result of applying the substitution  $\sigma$  to  $M$ . Only after this will we be able to define the composition of two substitutions. However, there is some work we need to do before we are able to do this.

We can define the composition of a substitution and a replacement as follows

$\text{infix } 75 \ \_ \bullet_1 \_$   
 $\_ \bullet_1 \_ : \forall \{U\} \{V\} \{W\} \rightarrow \text{Rep } V \ W \rightarrow \text{Sub } U \ V \rightarrow \text{Sub } U \ W$   
 $(\rho \bullet_1 \sigma) \ K \ x = \text{rep } (\sigma \ K \ x) \ \rho$

$\text{infix } 75 \ \_ \bullet_2 \_$   
 $\_ \bullet_2 \_ : \forall \{U\} \{V\} \{W\} \rightarrow \text{Sub } V \ W \rightarrow \text{Rep } U \ V \rightarrow \text{Sub } U \ W$   
 $(\sigma \bullet_2 \rho) \ K \ x = \sigma \ K \ (\rho \ K \ x)$

Given a substitution  $\sigma : U \Rightarrow V$ , define a substitution  $(\sigma, K) : (U, K) \Rightarrow (V, K)$  as follows.

$\text{Sub}\uparrow : \forall \{U\} \{V\} \{K\} \rightarrow \text{Sub } U \ V \rightarrow \text{Sub } (U, K) \ (V, K)$   
 $\text{Sub}\uparrow \_ \_ \ x_0 = \text{var } x_0$   
 $\text{Sub}\uparrow \sigma \ K \ (\uparrow \ x) = \text{liftE } (\sigma \ K \ x)$

$\text{Sub}\uparrow\text{-wd} : \forall \{U\} \{V\} \{K\} \{\sigma \ \sigma' : \text{Sub } U \ V\} \rightarrow \sigma \sim \sigma' \rightarrow \text{Sub}\uparrow \{K = K\} \sigma \sim \text{Sub}\uparrow \sigma'$   
 $\text{Sub}\uparrow\text{-wd } \{K = K\} \sigma\text{-is-}\sigma' \ \_ \ x_0 = \text{ref}$   
 $\text{Sub}\uparrow\text{-wd } \sigma\text{-is-}\sigma' \ L \ (\uparrow \ x) = \text{wd liftE } (\sigma\text{-is-}\sigma' \ L \ x)$

**Lemma 1.** *The operations we have defined satisfy the following properties.*

1.  $(\text{id}_V, K) = \text{id}_{(V, K)}$
2.  $(\rho \bullet_1 \sigma, K) = (\rho, K) \bullet_1 (\sigma, K)$

$$3. (\sigma \bullet_2 \rho, K) = (\sigma, K) \bullet_2 (\rho, K)$$

$$\text{Sub}\uparrow\text{-id} : \forall \{V\} \{K\} \rightarrow \text{Sub}\uparrow \{V\} \{V\} \{K\} \text{idSub} \sim \text{idSub}$$

$$\text{Sub}\uparrow\text{-id} \{K = K\} \_ \_ x_0 = \text{ref}$$

$$\text{Sub}\uparrow\text{-id} \_ (\uparrow \_) = \text{ref}$$

$$\text{Sub}\uparrow\text{-comp}_1 : \forall \{U\} \{V\} \{W\} \{K\} \{\rho : \text{Rep } V \ W\} \{\sigma : \text{Sub } U \ V\} \rightarrow \text{Sub}\uparrow (\rho \bullet_1 \sigma) \sim \text{Rep}\uparrow \rho \bullet_1 \sigma$$

$$\text{Sub}\uparrow\text{-comp}_1 \{K = K\} \_ \_ x_0 = \text{ref}$$

$$\text{Sub}\uparrow\text{-comp}_1 \{U\} \{V\} \{W\} \{K\} \{\rho\} \{\sigma\} L (\uparrow x) = \text{let open Equational-Reasoning (Expression)}$$

$$\quad \therefore \text{liftE (rep } (\sigma \text{ L } x) \rho)$$

$$\equiv \text{rep } (\sigma \text{ L } x) (\lambda \_ x \rightarrow \uparrow (\rho \_ x)) \llbracket \text{rep-comp } \{E = \sigma \text{ L } x\} \rrbracket$$

$$\equiv \text{rep (liftE } (\sigma \text{ L } x)) (\text{Rep}\uparrow \rho) \llbracket \text{rep-comp} \rrbracket$$

$$\text{Sub}\uparrow\text{-comp}_2 : \forall \{U\} \{V\} \{W\} \{K\} \{\sigma : \text{Sub } V \ W\} \{\rho : \text{Rep } U \ V\} \rightarrow \text{Sub}\uparrow \{K = K\} (\sigma \bullet_2 \rho) \sim \sigma \bullet_2 \rho$$

$$\text{Sub}\uparrow\text{-comp}_2 \{K = K\} \_ \_ x_0 = \text{ref}$$

$$\text{Sub}\uparrow\text{-comp}_2 L (\uparrow x) = \text{ref}$$

We can now define the result of applying a substitution  $\sigma$  to an expression  $E$ , which we denote  $E[\sigma]$ .

## 4 Contexts

A *context* has the form  $x_1 : A_1, \dots, x_n : A_n$  where, for each  $i$ :

- $x_i$  is a variable of kind  $K_i$  distinct from  $x_1, \dots, x_{i-1}$ ;
- $A_i$  is an expression of some kind  $L_i$ ;
- $L_i$  is a parent of  $K_i$ .

The *domain* of this context is the alphabet  $\{x_1, \dots, x_n\}$ .

data Context (K : VarKind) : Alphabet → Set where  
 $\langle \rangle : \text{Context } K \ \emptyset$

## 5 Propositional Logic

Fix sets of *proof variables* and *term variables*.

The syntax of the system is given by the following grammar.

$$\begin{array}{lll}
 \text{Proof} & \delta & ::= p \mid \delta\delta \mid \lambda p : \phi.\delta \\
 \text{Proposition} & f & ::= \perp \mid \phi \rightarrow \phi \\
 \text{Context} & \Gamma & ::= \langle \rangle \mid \Gamma, p : \phi \\
 \text{Judgement} & \mathcal{J} & ::= \Gamma \vdash \delta : \phi
 \end{array}$$

where  $p$  ranges over proof variables and  $x$  ranges over term variables. The variable  $p$  is bound within  $\delta$  in the proof  $\lambda p : \phi.\delta$ , and the variable  $x$  is bound within  $M$  in the term  $\lambda x : A.M$ . We identify proofs and terms up to  $\alpha$ -conversion.

## 6 Predicative Higher-Order Propositional Logic

Fix sets of *proof variables* and *term variables*.

The syntax of the system is given by the following grammar.

Proof	$\delta ::= p \mid \delta\delta \mid \lambda p : \phi. \delta$
Term	$M, \phi ::= x \mid \perp \mid MM \mid \lambda x : A. M \mid \phi \rightarrow \phi$
Type	$A ::= \Omega \mid A \rightarrow A$
Term Context	$\Gamma ::= \langle \rangle \mid \Gamma, x : A$
Proof Context	$\Delta ::= \langle \rangle \mid \Delta, p : \phi$
Judgement	$\mathcal{J} ::= \Gamma \text{ valid} \mid \Gamma \vdash M : A \mid \Gamma, \Delta \text{ valid} \mid \Gamma, \Delta \vdash \delta : \phi$

where  $p$  ranges over proof variables and  $x$  ranges over term variables. The variable  $p$  is bound within  $\delta$  in the proof  $\lambda p : \phi. \delta$ , and the variable  $x$  is bound within  $M$  in the term  $\lambda x : A. M$ . We identify proofs and terms up to  $\alpha$ -conversion.

In the implementation, we write **Term**( $V$ ) for the set of all terms with free variables a subset of  $V$ , where  $V : \mathbf{FinSet}$ .
