Type Theories with Computation Rules for the Univalence Axiom

Robin Adams

January 17, 2016

module main where

1 Preliminaries

module Prelims where

1.1 Functions

We write id_A for the identity function on the type A, and $g \circ f$ for the composition of functions g and f.

```
id : \forall (A : Set) \rightarrow A \rightarrow A id A x = x infix 75 _o_ _ _ . \forall {A B C : Set} \rightarrow (B \rightarrow C) \rightarrow (A \rightarrow B) \rightarrow A \rightarrow C (g \circ f) x = g (f x)
```

1.2 Equality

We use the inductively defined equality = on every datatype.

```
data \_\equiv {A : Set} (a : A) : A \rightarrow Set where ref : a \equiv a subst : \forall {A : Set} (P : A \rightarrow Set) {a} {b} \rightarrow a \equiv b \rightarrow P a \rightarrow P b subst P ref Pa = Pa sym : \forall {A : Set} {a b : A} \rightarrow a \equiv b \rightarrow b \equiv a sym ref = ref trans : \forall {A : Set} {a b c : A} \rightarrow a \equiv b \rightarrow b \equiv c \rightarrow a \equiv c trans ref ref = ref
```

wd :
$$\forall$$
 {A B : Set} (f : A \rightarrow B) {a a' : A} \rightarrow a \equiv a' \rightarrow f a \equiv f a' wd _ ref = ref wd2 : \forall {A B C : Set} (f : A \rightarrow B \rightarrow C) {a a' : A} {b b' : B} \rightarrow a \equiv a' \rightarrow b \equiv b' \rightarrow f a wd2 _ ref ref = ref module Equational-Reasoning (A : Set) where \therefore : \forall (a : A) \rightarrow a \equiv a \therefore _ = ref

=[_] : \forall {a b : A} \rightarrow a \equiv b \rightarrow \forall c \rightarrow b \equiv c \rightarrow a \equiv c δ \equiv c [δ '] = trans δ δ '

=[[_]] :
$$\forall$$
 {a b : A} \rightarrow a \equiv b \rightarrow \forall c \rightarrow c \equiv b \rightarrow a \equiv c δ \equiv c [[δ ']] = trans δ (sym δ ')

We also write $f \sim g$ iff the functions f and g are extensionally equal, that is, f(x) = g(x) for all x.

2 Datatypes

We introduce a universe **FinSet** of (names of) finite sets. There is an empty set \emptyset : **FinSet**, and for every A: **FinSet**, the type A+1: **FinSet** has one more element:

$$A+1=\{\bot\}\uplus\{\uparrow a:a\in A\}$$

data FinSet : Set where

 \emptyset : FinSet

 $\mathtt{Lift} \; : \; \mathtt{FinSet} \; \rightarrow \; \mathtt{FinSet}$

data El : FinSet \rightarrow Set where \bot : \forall {V} \rightarrow El (Lift V) \uparrow : \forall {V} \rightarrow El V \rightarrow El (Lift V)

Given $f: A \to B$, define $f+1: A+1 \to B+1$ by

$$(f+1)(\bot) = \bot$$
$$(f+1)(\uparrow x) = \uparrow f(x)$$

lift : \forall {U} {V} \to (El U \to El V) \to El (Lift U) \to El (Lift V) lift _ \bot = \bot

3 Predicative Higher-Order Propositional Logic

Fix sets of proof variables and term variables.

The syntax of the system is given by the following grammar.

Proof
$$\delta ::= p \mid \delta\delta \mid \lambda p : \phi.\delta$$
Term
$$M, \phi ::= x \mid \bot \mid MM \mid \phi \to \phi \mid \lambda x : A.M$$
Type
$$A ::= \Omega \mid A \to A$$
Context
$$\Gamma ::= \langle \rangle \mid \Gamma, p : \phi \mid \Gamma, x : A$$
Judgement
$$\mathcal{J} ::= \Gamma \text{ valid } \mid \Gamma \vdash \delta : \phi \mid \Gamma \vdash M : A$$

where p ranges over proof variables and x ranges over term variables. The variable p is bound within δ in the proof $\lambda p : \phi.\delta$, and the variable x is bound within M in the term $\lambda x : A.M$. We identify proofs and terms up to α -conversion.

In the implementation, we write $\mathbf{Term}(V)$ for the set of all terms with free variables a subset of V, where $V : \mathbf{FinSet}$.

```
infix 80 \_\Rightarrow\_ data Type : Set where \Omega : Type \_\Rightarrow\_ : Type \rightarrow Term V is the set of all terms M with FV(M) \subseteq V data Term : FinSet \rightarrow Set where var : \forall {V} \rightarrow El V \rightarrow Term V \bot : \forall {V} \rightarrow Term V
```

```
\mathtt{app} \; : \; \forall \; \{\mathtt{V}\} \; \rightarrow \; \mathtt{Term} \; \, \mathtt{V} \; \rightarrow \; \mathtt{Term} \; \, \mathtt{V} \; \rightarrow \; \mathtt{Term} \; \, \mathtt{V}
