Type Theories with Computation Rules for the Univalence Axiom

Robin Adams

January 20, 2016

module main where

1 Preliminaries

module Prelims where

1.1 Functions

We write id_A for the identity function on the type A, and $g \circ f$ for the composition of functions g and f.

```
id : \forall (A : Set) \rightarrow A \rightarrow A id A x = x infix 75 _o_ _ _ . \forall {A B C : Set} \rightarrow (B \rightarrow C) \rightarrow (A \rightarrow B) \rightarrow A \rightarrow C (g \circ f) x = g (f x)
```

1.2 Equality

We use the inductively defined equality = on every datatype.

```
infix 50 _=_ data _=_ {A : Set} (a : A) : A \rightarrow Set where ref : a \equiv a subst : \forall {A : Set} (P : A \rightarrow Set) {a} {b} \rightarrow a \equiv b \rightarrow P a \rightarrow P b subst P ref Pa = Pa sym : \forall {A : Set} {a b : A} \rightarrow a \equiv b \rightarrow b \equiv a sym ref = ref trans : \forall {A : Set} {a b c : A} \rightarrow a \equiv b \rightarrow b \equiv c \rightarrow a \equiv c
```

```
trans ref ref = ref
wd : \forall {A B : Set} (f : A \rightarrow B) {a a' : A} \rightarrow a \equiv a' \rightarrow f a \equiv f a'
wd _ ref = ref
wd2 _ ref ref = ref
module Equational-Reasoning (A : Set) where
   infix 2 ∵_
   \because_ : \forall (a : A) \rightarrow a \equiv a
   ∵ _ = ref
  infix 1 _{\equiv}[]
   _=_[_] : \forall {a b : A} \rightarrow a \equiv b \rightarrow \forall c \rightarrow b \equiv c \rightarrow a \equiv c
   \delta \equiv c [ \delta ' ] = trans \delta \delta '
  infix 1 _{\equiv}[[_]]
   \_\equiv \_[[\_]] \; : \; \forall \; \{a\;b\; : \; A\} \; \rightarrow \; a \; \equiv \; b \; \rightarrow \; \forall \;\; c \; \rightarrow \; c \; \equiv \; b \; \rightarrow \; a \; \equiv \; c
   \delta \equiv c \ [[\ \delta'\ ]] = trans \ \delta \ (sym \ \delta')
    We also write f \sim g iff the functions f and g are extensionally equal, that
is, f(x) = g(x) for all x.
infix 50 _{\sim}
_~_ : \forall {A B : Set} \rightarrow (A \rightarrow B) \rightarrow (A \rightarrow B) \rightarrow Set
```

2 **Datatypes**

 $\mathtt{f}\,\sim\,\mathtt{g}\,\mathtt{=}\,\forall\,\mathtt{x}\,\rightarrow\,\mathtt{f}\,\mathtt{x}\,\equiv\,\mathtt{g}\,\mathtt{x}$

We introduce a universe FinSet of (names of) finite sets. There is an empty set \emptyset : **FinSet**, and for every A: **FinSet**, the type A+1: **FinSet** has one more element:

$$A+1=\{\bot\}\uplus\{\uparrow a:a\in A\}$$

```
data FinSet : Set where
   \emptyset : FinSet
   \texttt{Lift} \; : \; \texttt{FinSet} \; \rightarrow \; \texttt{FinSet}
\mathtt{data}\ \mathtt{El}\ :\ \mathtt{FinSet}\ \to\ \mathtt{Set}\ \mathtt{where}
    \bot : \forall {V} \rightarrow El (Lift V)
   \uparrow : \forall {V} \rightarrow El V \rightarrow El (Lift V)
```

A replacement from U to V is simply a function $U \to V$.

```
\mathtt{Rep} \; : \; \mathtt{FinSet} \; \rightarrow \; \mathtt{FinSet} \; \rightarrow \; \mathtt{Set}
\texttt{Rep U V = El U} \, \rightarrow \, \texttt{El V}
```

```
Given f: A \to B, define f+1: A+1 \to B+1 by
                                            (f+1)(\perp) = \perp
                                           (f+1)(\uparrow x) = \uparrow f(x)
lift : \forall {U} {V} \rightarrow Rep U V \rightarrow Rep (Lift U) (Lift V)
lift _ \bot = \bot
lift f (\uparrow x) = \uparrow (f x)
liftwd : \forall {U} {V} {f g : Rep U V} \rightarrow f \sim g \rightarrow lift f \sim lift g
liftwd f-is-g \perp = ref
liftwd f-is-g (\uparrow x) = wd \uparrow (f-is-g x)
     This makes (-) + 1 into a functor FinSet \rightarrow FinSet; that is,
                                        id_V + 1 = id_{V+1}
                                    (g \circ f) + 1 = (g+1) \circ (f+1)
liftid : \forall {V} \rightarrow lift (id (El V)) \sim id (El (Lift V))
liftid \perp = ref
liftid (\uparrow _) = ref
\texttt{liftcomp} \; : \; \forall \; \{\texttt{U}\} \; \{\texttt{W}\} \; \{\texttt{g} \; : \; \texttt{Rep} \; \texttt{V} \; \texttt{W}\} \; \{\texttt{f} \; : \; \texttt{Rep} \; \texttt{U} \; \texttt{V}\} \; \rightarrow \; \texttt{lift} \; (\texttt{g} \; \circ \; \texttt{f}) \; \sim \; \texttt{lift} \; \texttt{g} \; \circ \; \texttt{lift} \; \texttt{f}
liftcomp \perp = ref
liftcomp (\uparrow _) = ref
open import Prelims
```

3 Predicative Higher-Order Propositional Logic

Fix sets of proof variables and term variables.

The syntax of the system is given by the following grammar.

```
\begin{array}{lll} \text{Proof} & \delta & ::= & p \mid \delta\delta \mid \lambda p : \phi.\delta \\ \text{Term} & M, \phi & ::= & x \mid \bot \mid MM \mid \phi \rightarrow \phi \mid \lambda x : A.M \\ \text{Type} & A & ::= & \Omega \mid A \rightarrow A \\ \text{Term Context} & \Gamma & ::= & \langle \rangle \mid \Gamma, x : A \\ \text{Proof Context} & \Delta & ::= & \langle \rangle \mid \Delta, p : \phi \\ \text{Judgement} & \mathcal{J} & ::= & \Gamma \text{ valid } \mid \Gamma \vdash M : A \mid \Gamma, \Delta \text{ valid } \mid \Gamma \vdash \delta : \phi \end{array}
```

where p ranges over proof variables and x ranges over term variables. The variable p is bound within δ in the proof $\lambda p : \phi.\delta$, and the variable x is bound within M in the term $\lambda x : A.M$. We identify proofs and terms up to α -conversion.

In the implementation, we write $\mathbf{Term}(V)$ for the set of all terms with free variables a subset of V, where $V : \mathbf{FinSet}$.

```
infix 80 \Rightarrow
data Type : Set where
   \Omega : Type
   \_\Rightarrow\_ : Type \to Type \to Type
--Context V P is the set of all contexts whose domain consists of the term variables in
infix 80 _,_
data \texttt{TContext} : \texttt{FinSet} \to \texttt{Set} where
   \langle \rangle: TContext \emptyset
   _,_ : \forall {V} \rightarrow TContext V \rightarrow Type \rightarrow TContext (Lift V)
--Term V is the set of all terms M with FV(M) \subseteq V
data Term : FinSet \rightarrow Set where
   \mathtt{var} \;:\; \forall \;\; \{\mathtt{V}\} \;\to\; \mathtt{El} \;\; \mathtt{V} \;\to\; \mathtt{Term} \;\; \mathtt{V}
   \bot : \forall {V} \rightarrow Term V
   \mathtt{app} \; : \; \forall \; \{\mathtt{V}\} \; \rightarrow \; \mathtt{Term} \; \, \mathtt{V} \; \rightarrow \; \mathtt{Term} \; \, \mathtt{V} \; \rightarrow \; \mathtt{Term} \; \, \mathtt{V}
   \Lambda \;:\; \forall \;\; \{\mathtt{V}\} \;\to\; \mathtt{Type} \;\to\; \mathtt{Term} \;\; (\mathtt{Lift} \;\; \mathtt{V}) \;\to\; \mathtt{Term} \;\; \mathtt{V}
   \_\Rightarrow\_ : \forall {V} \rightarrow Term V \rightarrow Term V \rightarrow Term V
data PContext (V : FinSet) : FinSet 
ightarrow Set where
   \langle \rangle : PContext V \emptyset
   _,_ : \forall {P} \rightarrow PContext V P \rightarrow Term V \rightarrow PContext V (Lift P)
--Proof V P is the set of all proofs with term variables among V and proof variables among V
data Proof (V : FinSet) : FinSet 
ightarrow Set_1 where
   \texttt{var} \;:\; \forall \; \{\texttt{P}\} \;\to\; \texttt{El} \;\; \texttt{P} \;\to\; \texttt{Proof} \;\; \texttt{V} \;\; \texttt{P}
   app : \forall {P} \rightarrow Proof V P \rightarrow Proof V P \rightarrow Proof V P
   \Lambda : \forall {P} 	o Term V 	o Proof V (Lift P) 	o Proof V P
    Let U, V : \mathbf{FinSet}. A replacement from U to V is just a function U \to V.
Given a term M : \mathbf{Term}(U) and a replacement \rho : U \to V, we write M\{\rho\}:
Term (V) for the result of replacing each variable x in M with \rho(x).
infix 60 _<_>
_<_> : \forall {U V} \rightarrow Term U \rightarrow Rep U V \rightarrow Term V
(\text{var } x) < \rho > = \text{var } (\rho x)
\perp < \rho > = \perp
(app M N) < \rho > = app (M < \rho >) (N < \rho >)
(\Lambda \land M) < \rho > = \Lambda \land (M < lift \rho >)
(\phi \Rightarrow \psi) < \rho > = (\phi < \rho >) \Rightarrow (\psi < \rho >)
     With this as the action on arrows, Term() becomes a functor FinSet \rightarrow
Set.
repwd : \forall {U V : FinSet} {\rho \rho' : El U \rightarrow El V} \rightarrow \rho \sim \rho' \rightarrow \forall M \rightarrow M < \rho > \equiv M < \rho' >
repwd \rho-is-\rho' (var x) = wd var (\rho-is-\rho' x)
```

repwd ρ -is- ρ ' \perp = ref

```
repwd \rho-is-\rho' (app M N)= wd2 app (repwd \rho-is-\rho' M) (repwd \rho-is-\rho' N)
repwd \rho-is-\rho' (\Lambda A M) = wd (\Lambda A) (repwd (liftwd \rho-is-\rho') M)

repid \perp = ref
repid (app M N) = wd2 app (repid M) (repid N)
repid (\Lambda A M) = wd (\Lambda A) (trans (repwd liftid M) (repid M))
repid (\phi \Rightarrow \psi) = wd2 \Rightarrow (repid \phi) (repid \psi)
repcomp : \forall {U V W : FinSet} (\sigma : El V \rightarrow El W) (\rho : El U \rightarrow El V) M \rightarrow M < \sigma \circ \rho > \equiv M
repcomp \rho \sigma (var x) = ref
repcomp \rho \sigma \perp = ref
repcomp \rho \sigma (app M N) = wd2 app (repcomp \rho \sigma M) (repcomp \rho \sigma N)
repcomp \rho \sigma (\Lambda A M) = wd (\Lambda A) (trans (repwd liftcomp M) (repcomp (lift \rho) (lift \sigma) M))
repcomp \rho \ \sigma \ (\phi \Rightarrow \psi) = wd2 \ \_\Rightarrow \_ \ (repcomp \ \rho \ \sigma \ \phi) \ (repcomp \ \rho \ \sigma \ \psi)
    A substitution \sigma from U to V, \sigma: U \Rightarrow V, is a function \sigma: U \to \mathbf{Term}(V).
\mathtt{Sub} \; : \; \mathtt{FinSet} \; \rightarrow \; \mathtt{FinSet} \; \rightarrow \; \mathtt{Set}
Sub U V = El U \rightarrow Term V
    The identity substitution id_V: V \Rightarrow V is defined as follows.
idSub : \forall V \rightarrow Sub V V
idSub _ = var
    Given \sigma: U \Rightarrow V and M: \mathbf{Term}(U), we want to define M[\sigma]: \mathbf{Term}(V),
the result of applying the substitution \sigma to M. Only after this will we be able
to define the composition of two substitutions. However, there is some work we
need to do before we are able to do this.
    We can define the composition of a substitution and a replacement as follows.
infix 75 \_\bullet_1
\_ullet_1\_: \ orall \ \{\mathtt{V}\} \ \{\mathtt{W}\} \ 	o \ \mathtt{Rep} \ \mathtt{V} \ \mathtt{W} \ 	o \ \mathtt{Sub} \ \mathtt{U} \ \mathtt{V} \ 	o \ \mathtt{Sub} \ \mathtt{U} \ \mathtt{W}
(\rho \bullet_1 \sigma) u = \sigma u < \rho >
    (On the other side, given \rho: U \to V and \sigma: V \Rightarrow W, the composition is
just function composition \sigma \circ \rho : U \Rightarrow W.)
    Given a substitution \sigma: U \Rightarrow V, define the substitution \sigma+1: U+1 \Rightarrow V+1
as follows.
liftSub : \forall {U} {V} \rightarrow Sub U V \rightarrow Sub (Lift U) (Lift V)
liftSub \_ \perp = var \bot
liftSub \sigma (\uparrow x) = \sigma x < \uparrow >
liftSub-wd : \forall {U V} {\sigma \sigma' : Sub U V} \rightarrow \sigma \sim \sigma' \rightarrow liftSub \sigma \sim liftSub \sigma'
liftSub-wd \sigma-is-\sigma' \bot = ref
```

liftSub-wd σ -is- σ ' (\uparrow x) = wd (λ x \rightarrow x $\langle \uparrow \rangle$) (σ -is- σ ' x)

```
Lemma 1. The operations \mathfrak{fl}_1 and (-)+1 satisfiesd the following properties.
     1. id_V + 1 = id_{V+1}
    2. For \rho: V \to W and \sigma: U \Rightarrow V, we have (\rho \bullet \sigma) + 1 = (\rho + 1) \bullet (\sigma + 1).
    3. For \sigma: V \Rightarrow W and \rho: U \to V, we have (\sigma \circ \rho) + 1 = (\sigma + 1) \circ (\rho + 1).
\texttt{liftSub-id} \; : \; \forall \; \{ \texttt{V} \; : \; \texttt{FinSet} \} \; \rightarrow \; \texttt{liftSub} \; \; (\texttt{idSub} \; \, \texttt{V}) \; \sim \; \texttt{idSub} \; \; (\texttt{Lift} \; \, \texttt{V})
liftSub-id \perp = ref
