2 Datatypes

We introduce a universe **FinSet** of (names of) finite sets. There is an empty set \emptyset : **FinSet**, and for every A: **FinSet**, the type A+1: **FinSet** has one more element:

$$A+1 = \{\bot\} \uplus \{\uparrow a : a \in A\}$$

```
data FinSet : Set where \emptyset : FinSet 
Lift : FinSet \to FinSet 
data El : FinSet \to Set where 
\bot : \forall {V} \to El (Lift V) 
\uparrow : \forall {V} \to El V \to El (Lift V)
```

lift :
$$\forall$$
 {A} {B} \rightarrow (El A \rightarrow El B) \rightarrow El (Lift A) \rightarrow El (Lift B) lift _ \bot = \bot lift f (\uparrow x) = \uparrow (f x)

3 Grammars

module Grammar where

open import Prelims

Before we begin investigating the several theories we wish to consider, we present a general theory of syntax and capture-avoiding substitution.

A grammar consists of:

- a set of expression kinds;
- a subset of expression kinds, the *variable kinds*;
- a set of constructors, each with an associated constructor kind of the form

$$((A_{11}, \dots, A_{1r_1})B_1, \dots, (A_{m1}, \dots, A_{mr_m})B_m)C$$
 (1)

where each A_{ij} is a variable kind, and each B_i and C is an expression kind.

ullet a function assigning, to each variable kind K, an expression kind, the parent of K.

A constructor c of kind (1) is a constructor that takes m arguments of kind B_1, \ldots, B_m , and binds r_i variables in its ith argument of kind A_{ij} , producing an expression of kind C. We write this expression as

$$c([x_{11},\ldots,x_{1r_1}]E_1,\ldots,[x_{m1},\ldots,x_{mr_m}]E_m)$$
 (2)

The subexpressions of the form $[x_{i1}, \ldots, x_{ir_i}]E_i$ shall be called *abstractions*, and the pieces of syntax of the form $(A_{i1}, \ldots, A_{ij})B_i$ that occur in constructor kinds shall be called *abstraction kinds*.

 $\begin{array}{c} \texttt{record Taxonomy} \; : \; \texttt{Set}_1 \; \; \texttt{where} \\ \texttt{field} \end{array}$

VarKind : Set
NonVarKind : Set

data ExpressionKind : Set where
varKind : VarKind → ExpressionKind
nonVarKind : NonVarKind → ExpressionKind

data KindClass : Set where
-Expression : KindClass
-Abstraction : KindClass
-Constructor : ExpressionKind → KindClass

data Kind : KindClass ightarrow Set where

 $\begin{array}{lll} \texttt{base} & : & \texttt{ExpressionKind} \ \rightarrow \ \texttt{Kind} \ -\texttt{Expression} \\ \texttt{out} & : & \texttt{ExpressionKind} \ \rightarrow \ \texttt{Kind} \ -\texttt{Abstraction} \\ \end{array}$

 Π : VarKind o Kind -Abstraction o Kind -Abstraction

 \mathtt{out}_2 : \forall {K} o Kind (-Constructor K)

 $extsf{M}_2$: orall {K} o Kind -Abstraction o Kind (-Constructor K) o Kind (-Constructor K)

An alphabet $V = \{V_E\}_E$ consists of a set V_E of variables of kind E for each expression kind E. The expressions of kind E over the alphabet V are defined inductively by:

- Every variable of kind E is an expression of kind E.
- If c is a constructor of kind (1), each E_i is an expression of kind B_i , and each x_{ij} is a variable of kind A_{ij} , then (2) is an expression of kind C.

Each x_{ij} is bound within E_i in the expression (2). We identify expressions up to α -conversion.

```

idRep _ x = x
--We choose not to prove the category axioms, as they hold up to judgemental equality.
      Given a replacement \rho: U \to V, we can 'lift' this to a replacement (\rho, K):
```

 $(U,K) \to (V,K)$. Under this operation, the mapping (-,K) becomes an endofunctor on the category of alphabets and replacements.

```
\texttt{Rep} \!\! \uparrow \!\! - \texttt{id} \; : \; \forall \; \{\texttt{V}\} \; \{\texttt{K}\} \; \to \; \texttt{Rep} \!\! \uparrow \; (\texttt{idRep V}) \; \sim \!\! \texttt{R} \; \texttt{idRep} \; (\texttt{V} \; \text{, K})
Rep \uparrow -id x_0 = ref
Rep\uparrow-id (\uparrow _) = ref
```

Finally, we can define $E(\rho)$, the result of replacing each variable x in E with $\rho(x)$. Under this operation, the mapping Expression – K becomes a functor from the category of alphabets and replacements to the category of sets.

 This provides us with the canonical mapping from an expression over V to
```

an expression over (V, K):

```
liftE : \forall {V} {K} {L} \rightarrow Expression V L \rightarrow Expression (V , K) L
liftE E = E \langle (\lambda \rightarrow \uparrow) \rangle
```

A substitution σ from alphabet U to alphabet $V, \sigma: U \Rightarrow V$, is a function σ that maps every variable x of kind K in U to an expression $\sigma(x)$ of kind K over V. Then, given an expression E of kind K over U, we write $E[\sigma]$ for the result of substituting $\sigma(x)$ for x for each variable in E, avoiding capture.

```
{\tt Sub} \; : \; {\tt Alphabet} \; \to \; {\tt Alphabet} \; \to \; {\tt Set}
Sub U V = \forall K \rightarrow Var U K \rightarrow Expression V (varKind K)
```

~ :
$$\forall$$
 {U} {V} \rightarrow Sub U V \rightarrow Sub U V \rightarrow Set σ \sim τ = \forall K x \rightarrow σ K x \equiv τ K x

The *identity* substitution $id_V: V \to V$ is defined as follows.

```
\begin{array}{lll} {\tt idSub} \ : \ \forall \ \{{\tt V}\} \ \to \ {\tt Sub} \ {\tt V} \ {\tt V} \\ {\tt idSub} \ \_ \ = \ {\tt var} \end{array}
```

infix 75 $_\bullet_1$

Given $\sigma: U \to V$ and an expression E over U, we want to define the expression $E[\sigma]$ over V, the result of applying the substitution σ to M. Only after this will we be able to define the composition of two substitutions. However, there is some work we need to do before we are able to do this.

We can define the composition of a substitution and a replacement as follows

Lemma 1. The operations we have defined satisfy the following properties.

```
1. (\operatorname{id}_V,K)=\operatorname{id}_{(V,K)}
2. (\rho\bullet_1\sigma,K)=(\rho,K)\bullet_1(\sigma,K)
3. (\sigma\bullet_2\rho,K)=(\sigma,K)\bullet_2(\rho,K)

5 Propositional Logic

Fix sets of proof variables and term variables.

The syntax of the system is given by the following grammar.

```
\begin{array}{lll} \text{Proof} & \delta & ::= & p \mid \delta\delta \mid \lambda p : \phi.\delta \\ \text{Proposition} & f & ::= & \bot \mid \phi \to \phi \\ \text{Context} & \Gamma & ::= & \langle \rangle \mid \Gamma, p : \phi \\ \text{Judgement} & \mathcal{J} & ::= & \Gamma \vdash \delta : \phi \end{array}
```

where p ranges over proof variables and x ranges over term variables. The variable p is bound within δ in the proof $\lambda p : \phi.\delta$, and the variable x is bound within M in the term $\lambda x : A.M$. We identify proofs and terms up to α -conversion.

6 Predicative Higher-Order Propositional Logic

Fix sets of proof variables and term variables.

(Weakening $\Gamma \vdash \delta :: \phi \rightarrow \psi \rho :: \Gamma \rightarrow \Delta$))

The syntax of the system is given by the following grammar.

```
\begin{array}{lll} \text{Proof} & \delta & ::= & p \mid \delta\delta \mid \lambda p : \phi.\delta \\ \text{Term} & M, \phi & ::= & x \mid \bot \mid MM \mid \lambda x : A.M \mid \phi \rightarrow \phi \\ \text{Type} & A & ::= & \Omega \mid A \rightarrow A \\ \text{Term Context} & \Gamma & ::= & \langle \rangle \mid \Gamma, x : A \\ \text{Proof Context} & \Delta & ::= & \langle \rangle \mid \Delta, p : \phi \\ \text{Judgement} & \mathcal{J} & ::= & \Gamma \text{ valid } \mid \Gamma \vdash M : A \mid \Gamma, \Delta \text{ valid } \mid \Gamma, \Delta \vdash \delta : \phi \end{array}
```

where p ranges over proof variables and x ranges over term variables. The variable p is bound within δ in the proof $\lambda p : \phi.\delta$, and the variable x is bound within M in the term $\lambda x : A.M$. We identify proofs and terms up to α -conversion.

In the implementation, we write $\mathbf{Term}(V)$ for the set of all terms with free variables a subset of V, where $V : \mathbf{FinSet}$.
