## 2 Datatypes

We introduce a universe **FinSet** of (names of) finite sets. There is an empty set  $\emptyset$ : **FinSet**, and for every A: **FinSet**, the type A+1: **FinSet** has one more

element:

$$A+1=\{\bot\}\uplus\{\uparrow a:a\in A\}$$

data FinSet : Set where

∅ : FinSet

 $\mathtt{Lift} \; : \; \mathtt{FinSet} \; \rightarrow \; \mathtt{FinSet}$ 

 $\mathtt{data}\ \mathtt{El}\ :\ \mathtt{FinSet}\ \to\ \mathtt{Set}\ \mathtt{where}$ 

 $\bot$  :  $\forall$  {V}  $\rightarrow$  El (Lift V)

 $\uparrow$  :  $\forall$  {V}  $\rightarrow$  El V  $\rightarrow$  El (Lift V)

A replacement from U to V is simply a function  $U \to V$ .

 $\mathtt{Rep} \; : \; \mathtt{FinSet} \; \rightarrow \; \mathtt{FinSet} \; \rightarrow \; \mathtt{Set}$ 

Rep U V = El U  $\rightarrow$  El V

Given  $f: A \to B$ , define  $f+1: A+1 \to B+1$  by

$$(f+1)(\bot) = \bot$$
$$(f+1)(\uparrow x) = \uparrow f(x)$$

lift :  $\forall$  {U} {V}  $\rightarrow$  Rep U V  $\rightarrow$  Rep (Lift U) (Lift V)

lift  $\bot$  =  $\bot$ 

lift f ( $\uparrow$  x) =  $\uparrow$  (f x)

liftwd :  $\forall$  {U} {V} {f g : Rep U V}  $\rightarrow$  f  $\sim$  g  $\rightarrow$  lift f  $\sim$  lift g

liftwd f-is-g  $\perp$  = ref

liftwd f-is-g ( $\uparrow$  x) = wd  $\uparrow$  (f-is-g x)

This makes (-) + 1 into a functor **FinSet**  $\rightarrow$  **FinSet**; that is,

$$id_V + 1 = id_{V+1}$$
  
 $(g \circ f) + 1 = (g+1) \circ (f+1)$ 

liftid :  $\forall$  {V}  $\rightarrow$  lift (id (El V))  $\sim$  id (El (Lift V))

liftid  $\perp$  = ref

liftid ( $\uparrow$  \_) = ref

liftcomp :  $\forall$  {U} {V} {W} {g : Rep V W} {f : Rep U V}  $\rightarrow$  lift (g  $\circ$  f)  $\sim$  lift g  $\circ$  lift f

liftcomp  $\perp$  = ref

liftcomp ( $\uparrow$  \_) = ref

data List (A : Set) : Set where

 $\langle \rangle$  : List A

\_::\_ : List A ightarrow A ightarrow List A

open import Prelims

module PL where

open import Prelims

## 3 Propositional Logic

Fix sets of proof variables and term variables.

The syntax of the system is given by the following grammar.

```
\begin{array}{lll} \text{Proof} & \delta & ::= & p \mid \delta\delta \mid \lambda p : \phi.\delta \\ \text{Proposition} & \phi & ::= & \bot \mid \phi \to \phi \\ \text{Proof Context} & \Delta & ::= & \langle \rangle \mid \Delta, p : \phi \\ \text{Judgement} & \mathcal{J} & ::= & \Delta \vdash \delta : \phi \end{array}
```

where p ranges over proof variables and x ranges over term variables. The variable p is bound within  $\delta$  in the proof  $\lambda p : \phi.\delta$ , and the variable x is bound within M in the term  $\lambda x : A.M$ . We identify proofs and terms up to  $\alpha$ -conversion.

We write **Proof** (P) for the set of all proofs  $\delta$  with FV ( $\delta$ )  $\subseteq V$ .

```
infix 75 _⇒_ data Prp : Set where 

\bot : Prp 

\_\Rightarrow_- : Prp \to Prp \to Prp 

infix 80 _,_ data PContext : FinSet \to Set where 

\langle\rangle : PContext \emptyset 

\_,_- : \forall {P} \to PContext P \to Prp \to PContext (Lift P) 

propof : \forall {P} \to El P \to PContext P \to Prp 

propof \bot (_ , \phi) = \phi 

propof (\uparrow p) (\Gamma , _) = propof p \Gamma 

data Proof : FinSet \to Set where 

var : \forall {P} \to El P \to Proof P \to Proof P 

app : \forall {P} \to Proof P \to Proof P \to Proof P
```

Let  $P, Q : \mathbf{FinSet}$ . Given a term  $M : \mathbf{Proof}(P)$  and a replacement  $\rho : P \to Q$ , we write  $M\{\rho\} : \mathbf{Proof}(Q)$  for the result of replacing each variable x in M with  $\rho(x)$ .

```
infix 60 _<_> _<_> : \forall {P Q} \rightarrow Proof P \rightarrow Rep P Q \rightarrow Proof Q var p < \rho > = var (\rho p) app \delta \epsilon < \rho > = app (\delta < \rho >) (\epsilon < \rho >) \Lambda \phi \delta < \rho > = \Lambda \phi (\delta < lift \rho >)
```

With this as the action on arrows, **Proof** () becomes a functor **FinSet**  $\rightarrow$  **Set**.

```
repwd : \forall {P Q : FinSet} {\rho \rho' : El P \rightarrow El Q} \rightarrow \rho \sim \rho' \rightarrow \forall \delta \rightarrow \delta < \rho > \equiv \delta < \rho' >
repwd \rho-is-\rho' (var p) = wd var (\rho-is-\rho' p)
repwd \rho-is-\rho' (app \delta \epsilon) = wd2 app (repwd \rho-is-\rho' \delta) (repwd \rho-is-\rho' \epsilon)
repwd \rho-is-\rho' (\Lambda \phi \delta) = wd (\Lambda \phi) (repwd (liftwd \rho-is-\rho') \delta)
repid : \forall {Q : FinSet} \delta \rightarrow \delta < id (El Q) > \equiv \delta
repid (var _) = ref
repid (app \delta \epsilon) = wd2 app (repid \delta) (repid \epsilon)
repid \{Q\} (\Lambda \phi \delta) = wd (\Lambda \phi) (let open Equational-Reasoning (Proof (Lift Q)) in
   :: \delta < \text{lift (id (El Q))} >
   \equiv \delta < id (El (Lift Q)) > [ repwd liftid \delta ]
                                              [ repid \delta ])
repcomp : \forall {P Q R : FinSet} (\rho : El Q \rightarrow El R) (\sigma : El P \rightarrow El Q) M \rightarrow M < \rho \circ \sigma > \equiv M
repcomp \rho \sigma (var _) = ref
repcomp \rho \sigma (app \delta \epsilon) = wd2 app (repcomp \rho \sigma \delta) (repcomp \rho \sigma \epsilon)
repcomp \{R = R\} \rho \sigma (\Lambda \phi \delta) = wd (\Lambda \phi) (let open Equational-Reasoning (Proof (Lift R))
   :: \delta < \text{lift } (\rho \circ \sigma) >
   \equiv \delta < lift \rho \circ lift \sigma >
                                                 [ repwd liftcomp \delta ]
   \equiv (\delta < lift \sigma >) < lift \rho > [ repcomp _ \delta ])
    A substitution \sigma from P to Q, \sigma: P \Rightarrow Q, is a function \sigma: P \to \mathbf{Proof}(Q).
\mathtt{Sub} \; : \; \mathtt{FinSet} \; \rightarrow \; \mathtt{FinSet} \; \rightarrow \; \mathtt{Set}
Sub P Q = El P \rightarrow Proof Q
    The identity substitution id_Q: Q \Rightarrow Q is defined as follows.
idSub : \forall Q \rightarrow Sub Q Q
idSub _ = var
```

Given  $\sigma: P \Rightarrow Q$  and  $M: \mathbf{Proof}(P)$ , we want to define  $M[\sigma]: \mathbf{Proof}(Q)$ , the result of applying the substitution  $\sigma$  to M. Only after this will we be able to define the composition of two substitutions. However, there is some work we need to do before we are able to do this.

We can define the composition of a substitution and a replacement as follows.

```
infix 75 _•1_ _•1_ : \forall {P} {Q} {R} \rightarrow Rep Q R \rightarrow Sub P Q \rightarrow Sub P R (\rho •1 \sigma) u = \sigma u < \rho >
```

(On the other side, given  $\rho: P \to Q$  and  $\sigma: Q \Rightarrow R$ , the composition is just function composition  $\sigma \circ \rho: P \Rightarrow R$ .)

Given a substitution  $\sigma:P\Rightarrow Q,$  define the substitution  $\sigma+1:P+1\Rightarrow Q+1$  as follows.

```
liftSub : \forall {P} {Q} \rightarrow Sub P Q \rightarrow Sub (Lift P) (Lift Q) liftSub _ \bot = var \bot
```

```
liftSub \sigma (\uparrow x) = \sigma x < \uparrow >
liftSub-wd : \forall {P Q} {\sigma \sigma' : Sub P Q} \rightarrow \sigma \sim \sigma' \rightarrow liftSub \sigma \sim liftSub \sigma'
liftSub-wd \sigma-is-\sigma' \perp = ref
liftSub-wd \sigma-is-\sigma' (\uparrow x) = wd (\lambda x \rightarrow x < \uparrow >) (\sigma-is-\sigma' x)
Lemma 1. The operations \bullet and (-) + 1 satisfiesd the following properties.
     1. id_Q + 1 = id_{Q+1}
    2. For \rho: Q \to R and \sigma: P \Rightarrow Q, we have (\rho \bullet \sigma) + 1 = (\rho + 1) \bullet (\sigma + 1).
    3. For \sigma: Q \Rightarrow R and \rho: P \to Q, we have (\sigma \circ \rho) + 1 = (\sigma + 1) \circ (\rho + 1).
\texttt{liftSub-id} \; : \; \forall \; \{ \texttt{Q} \; : \; \texttt{FinSet} \} \; \rightarrow \; \texttt{liftSub} \; \; (\texttt{idSub} \; \, \texttt{Q}) \; \sim \; \texttt{idSub} \; \; (\texttt{Lift} \; \, \texttt{Q})
liftSub-id \perp = ref
liftSub-id (\uparrow x) = ref
liftSub-comp<sub>1</sub> : \forall {P Q R : FinSet} (\sigma : Sub P Q) (\rho : Rep Q R) \rightarrow
    liftSub (\rho •1 \sigma) \sim lift \rho •1 liftSub \sigma
\texttt{liftSub-comp}_1 \ \sigma \ \rho \ \bot \ \texttt{= ref}
liftSub-comp<sub>1</sub> {R = R} \sigma \rho (\uparrow x) = let open Equational-Reasoning (Proof (Lift R)) in
      :: \sigma \times \langle \rho \rangle \langle \uparrow \rangle
      \equiv \sigma \times \langle \uparrow \circ \rho \rangle
                                                         [[repcomp \uparrow \rho (\sigma x)]]
      \equiv \sigma x < \uparrow > < \text{lift } \rho > [\text{ repcomp (lift } \rho) \uparrow (\sigma x)]
liftSub-comp_2 : \forall {P Q R : FinSet} (\sigma : Sub Q R) (\rho : Rep P Q) \rightarrow
    liftSub (\sigma \circ \rho) \sim liftSub \sigma \circ lift \rho
liftSub-comp<sub>2</sub> \sigma \rho \perp = ref
liftSub-comp<sub>2</sub> \sigma \rho (\uparrow x) = ref
      Now define M[\sigma] as follows.
infix 60 _[_]
\_[\![\_]\!] \;:\; \forall \; \{ \texttt{P} \; \texttt{Q} \;:\; \texttt{FinSet} \} \;\to\; \texttt{Proof} \; \texttt{P} \;\to\; \texttt{Sub} \; \texttt{P} \; \texttt{Q} \;\to\; \texttt{Proof} \; \texttt{Q}
(var x) \quad \llbracket \sigma \rrbracket = \sigma x
(\operatorname{app} \ \delta \ \epsilon) \ \llbracket \ \sigma \ \rrbracket = \operatorname{app} \ (\delta \ \llbracket \ \sigma \ \rrbracket) \ (\epsilon \ \llbracket \ \sigma \ \rrbracket)
(\Lambda \ \mathsf{A} \ \delta) \qquad [\![ \ \sigma \ ]\!] = \Lambda \ \mathsf{A} \ (\delta \ [\![ \ \mathsf{liftSub} \ \sigma \ ]\!])
\texttt{subwd} \,:\, \forall \,\, \{\texttt{P} \,\, \texttt{Q} \,:\, \texttt{FinSet}\} \,\, \{\sigma \,\, \sigma' \,:\, \texttt{Sub} \,\, \texttt{P} \,\, \texttt{Q}\} \,\rightarrow\, \sigma \,\, \sim\, \sigma' \,\, \rightarrow\, \forall \,\, \delta \,\rightarrow\, \delta \,\, \llbracket \,\, \sigma \,\, \rrbracket \,\, \equiv\, \delta \,\, \llbracket \,\, \sigma' \,\, \rrbracket
subwd \sigma-is-\sigma' (var x) = \sigma-is-\sigma' x
subwd \sigma-is-\sigma' (app \delta \epsilon) = wd2 app (subwd \sigma-is-\sigma' \delta) (subwd \sigma-is-\sigma' \epsilon)
subwd \sigma-is-\sigma' (\Lambda A \delta) = wd (\Lambda A) (subwd (liftSub-wd \sigma-is-\sigma') \delta)
```

This interacts with our previous operations in a good way:

#### Lemma 2.

1. 
$$M[id_Q] \equiv M$$

```
2. M[\rho \bullet \sigma] \equiv \delta[\sigma] \{\rho\}
        3. M[\sigma \circ \rho] \equiv \delta < \rho > [\sigma]

```

## 4 Predicative Higher-Order Propositional Logic

Fix sets of proof variables and term variables.

The syntax of the system is given by the following grammar.

```
\begin{array}{lll} \text{Proof} & \delta & ::= & p \mid \delta\delta \mid \lambda p : \phi.\delta \\ \text{Term} & M, \phi & ::= & x \mid \bot \mid MM \mid \phi \rightarrow \phi \mid \lambda x : A.M \\ \text{Type} & A & ::= & \Omega \mid A \rightarrow A \\ \text{Term Context} & \Gamma & ::= & \langle \rangle \mid \Gamma, x : A \\ \text{Proof Context} & \Delta & ::= & \langle \rangle \mid \Delta, p : \phi \\ \text{Judgement} & \mathcal{J} & ::= & \Gamma \text{ valid } \mid \Gamma \vdash M : A \mid \Gamma, \Delta \text{ valid } \mid \Gamma, \Delta \vdash \delta : \phi \end{array}
```

where p ranges over proof variables and x ranges over term variables. The variable p is bound within  $\delta$  in the proof  $\lambda p : \phi.\delta$ , and the variable x is bound within M in the term  $\lambda x : A.M$ . We identify proofs and terms up to  $\alpha$ -conversion.

In the implementation, we write  $\mathbf{Term}(V)$  for the set of all terms with free variables a subset of V, where  $V : \mathbf{FinSet}$ .

```
infix 80 \_\Rightarrow\_ data Type : Set where \Omega : Type \_\Rightarrow\_ : Type \to Tontext \to Set where \to Set where \to Set \to Tontext \to Type \to Tontext (Lift V) \to Term V is the set of all terms M with FV(M) \to V data Term : FinSet \to Set where \to Var : \forall {V} \to El V \to Term V
```

```

A substitution  $\sigma$  from U to V,  $\sigma: U \Rightarrow V$ , is a function  $\sigma: U \to \mathbf{Term}(V)$ .

```
\begin{array}{lll} \mathtt{Sub} & \colon \mathtt{FinSet} \ \to \ \mathtt{FinSet} \ \to \ \mathtt{Set} \\ \mathtt{Sub} \ \mathtt{U} \ \mathtt{V} \ = \ \mathtt{El} \ \mathtt{U} \ \to \ \mathtt{Term} \ \mathtt{V} \end{array}
```

The identity substitution  $id_V: V \Rightarrow V$  is defined as follows.

```
\begin{array}{lll} {\tt idSub} \ : \ \forall \ {\tt V} \ \rightarrow \ {\tt Sub} \ {\tt V} \ {\tt V} \\ {\tt idSub} \ \_ \ = \ {\tt var} \end{array}
```

Given  $\sigma: U \Rightarrow V$  and  $M: \mathbf{Term}(U)$ , we want to define  $M[\sigma]: \mathbf{Term}(V)$ , the result of applying the substitution  $\sigma$  to M. Only after this will we be able to define the composition of two substitutions. However, there is some work we need to do before we are able to do this.

We can define the composition of a substitution and a replacement as follows.

```
infix 75 _•1_ _•1_ : \forall {U} {V} {W} \rightarrow Rep V W \rightarrow Sub U V \rightarrow Sub U W (\rho •1 \sigma) u = \sigma u < \rho >
```

(On the other side, given  $\rho: U \to V$  and  $\sigma: V \Rightarrow W$ , the composition is just function composition  $\sigma \circ \rho: U \Rightarrow W$ .)

Given a substitution  $\sigma: U \Rightarrow V$ , define the substitution  $\sigma+1: U+1 \Rightarrow V+1$  as follows.

```
liftSub : \forall {U} {V} \rightarrow Sub U V \rightarrow Sub (Lift U) (Lift V) liftSub \_\bot = \text{var} \bot liftSub \sigma (\uparrow x) = \sigma x < \uparrow > liftSub-wd : \forall {U V} {\sigma \sigma' : Sub U V} \rightarrow \sigma \sim \sigma' \rightarrow liftSub \sigma \sim liftSub \sigma' liftSub-wd \sigma-is-\sigma' \bot = ref liftSub-wd \sigma-is-\sigma' (\uparrow x) = wd (\lambda x \rightarrow x < \uparrow >) (\sigma-is-\sigma' x)
```

**Lemma 9.** The operations  $\mathfrak{fl}_1$  and (-)+1 satisfiesd the following properties.

```
1. id_V + 1 = id_{V+1}
```

- 2. For  $\rho: V \to W$  and  $\sigma: U \Rightarrow V$ , we have  $(\rho \bullet \sigma) + 1 = (\rho + 1) \bullet (\sigma + 1)$ .
- 3. For  $\sigma: V \Rightarrow W$  and  $\rho: U \to V$ , we have  $(\sigma \circ \rho) + 1 = (\sigma + 1) \circ (\rho + 1)$ .

```
liftSub-id : \forall {V : FinSet} \rightarrow liftSub (idSub V) \sim idSub (Lift V) liftSub-id \bot = ref liftSub-id (\uparrow x) = ref
```

```
